## SUMMARY

#### Abstract

Spectra have been obtained of Olsen's suggested identifications of 4 C 3 r. 63 and 4 C 24.6. These show that the former is a quasar but the latter is a foreground star. Photoelectric $U B V R I$ magnitudes place the quasar among the io brightest known.

In his paper on optical identifications from the 4 C radio source catalogue, Olsen (1970) suggested a stellar object as candidate identification for ${ }_{4} \mathrm{C}_{3} \mathrm{I} .63$ $\left(=\mathrm{B}_{2} 2201+3 \mathrm{IA}\right)$. A finding chart is published in that paper. He obtained the following coordinates from the Palomar Sky Survey prints: $\alpha=22^{\mathrm{h}}$ oI $\mathrm{I}^{\mathrm{m}}$ or ${ }^{\mathrm{S}} \cdot \mathrm{I}$, $\delta=+3 \mathrm{I}^{\circ} 3 \mathrm{I}^{\prime} 1 \mathrm{o}^{\prime \prime}$ (1950.0). Medd et al. (1972) have found that the radio source has a peculiar radio spectrum and is a variable on a time scale of months at centimetre wavelengths. In this paper we report spectroscopic observations proving that the identification is a quasar, and photoelectric and photographic results on its colours and variability.

Spectra of the candidate were obtained in 1972 July and August using the image tube spectrograph of the $98-\mathrm{in}$. telescope at the Royal Greenwich Observatory, Herstmonceux. The spectra were taken at $210 \AA \mathrm{~mm}^{-1}$ using a McGee spectracon and cover the wavelength range $3200-5800 \AA$. The most conspicuous feature on these spectra is a broad emission line at $363 \mathrm{r} \AA$. Identifying this with Mg II $\lambda_{2798}$ gives a redshift $z_{\mathrm{em}}=0.298$. A further spectrum covering the red region was obtained on the Steward Observatory 90-in. reflector. Though only a print of this was available to the authors, it clearly shows broad emission lines at approximately 5326,5612 and $6310 \AA$ and a narrow emission line at $6482 \AA$. The broad lines are identified as $\mathrm{H}_{\delta}, \mathrm{H}_{\gamma}$ and $\mathrm{H}_{\beta}$ and the narrow line as [O III] $\lambda 5007$. These identifications confirm the redshift 0.298 very well. In addition, narrow absorption lines appear to be present in the short wavelength wings of $\mathrm{Mg} \operatorname{II}, \mathrm{H}_{\gamma}$ and $\mathrm{H}_{\beta}$, all near a redshift $z_{\mathrm{abs}}=0.282$. A summary of lines observed appears in Table I.

Table I
Observed
wavelength $\lambda_{0}$

| Emission lines |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 3631 | Mg II | $\lambda 2798$ | plate | - 2.298 | 80 |
| 5326 | $\mathrm{H}_{\delta}$ | $\lambda_{4102}$ |  | -0.298 | 60 |
| 5612 | $\mathrm{H}_{\gamma}$ | $\lambda 4340$ | print | $\{0.293$ | 80 |
| 6310 | $\mathrm{H}_{\beta}$ | $\lambda 486 \mathrm{r}$ | print | $\{0.298$ | 80 |
| 6482 | [ O III ] | $\lambda 5007$ |  | 0.295 | 15 |
| Absorption lines |  |  |  |  |  |
| 3587 | Mg II | $\lambda 2798$ | plate | $0 \cdot 282$ |  |
| 5574 | $\mathrm{H}_{\gamma}$ | $\lambda 4340$ \} | print | $\{0.284$ |  |
| 6223 | $\mathrm{H}_{\beta}$ | $\lambda 486 \mathrm{I}$ \} | print | $\{0.280$ |  |

Table II
Photoelectric results

|  | $U$ | $B$ | $V$ | $R$ | $I$ |
| :---: | :--- | :--- | :--- | :---: | :---: |
| 4C 31.63 | $15.14 \pm 0.1 \mathrm{I}$ | 15.50 | 15.47 | 15.03 | $14.45 \pm 0.07$ |
| Star A |  | 14.90 | 13.92 |  |  |
| B |  | 15.18 | 13.98 |  |  |
| C |  | $16.16 \pm 0.07$ | 15.37 |  |  |
| D |  | $17.27 \pm 0.17$ | $16.47 \pm 0.14$ |  |  |

The errors, based on eye estimates from pen recorder tracings, are less than $\circ^{m .05}$ unless otherwise quoted in the table. Errors in colours are likely to be less than this.

& \begin{aligned}
\log f_{\nu}= & -28 \cdot 79(U) \\
& -28 \cdot 56(B) \\
& -28 \cdot 61(V) \\
& -28 \cdot 55(R) \\
& -28 \cdot 43(I)
\end{aligned}
\end{aligned}
$$

Photoelectric $U B V R I$ magnitudes of the quasar were obtained using the Imperial College of Science and Technology $60-\mathrm{in}$. flux collector at Izaña, Tenerife. At the same time photoelectric $B$ and $V$ magnitudes were obtained for four comparison stars in the same field, for which a finding chart is given in Fig. r. The observations used the 'People's photometer' (Bingham, in preparation) operating in single-channel mode. One observation was made of each star in each waveband, on 1972 November 10-1 i. The magnitudes are on the system of Johnson et al. (1966).

Fig. r. Finding chart for the stars measured photoelectrically. The quasar is marked $Q$. North-east is at the top left-hand corner.

Table IV
Photographic results

| 1972 | $B$ magnitude | Standard error | Julian Date |
| :---: | :---: | :---: | :---: |
| Aug. 10-11 | 15.61 | 0.04 | 2441540. 53 |
| 11-12 | $15 \cdot 66$ | 0.03 | 541-57 |
| II-12 | 15.59 | 0.04 | 54I•58 |
| 11-12 | 15.76 | 0.03 | 54I•60 |
| 30-31 | $15 \cdot 68$ | 0.05 | $560 \cdot 49$ |
| Sep. 5-6 | $15 \cdot 66$ | 0.05 | $566 \cdot 40$ |
| 10-11 | 15.58 | 0.02 | 57I $\cdot 48$ |
| Oct. 4-5 | 15.67 | 0.03 | 595.39 |
| 6-7 | 15.71 | $0 \cdot 04$ | 597*45 |
| Dec. 3-4 | 15.6I | 0.02 | 655.36 |

The photoelectric results are summarized in Tables II and III. These show that the quasar is among the 10 brightest known. It has a typically flat spectrum. If confirmed, a possible small excess in the B band places the quasar fairly low in the region of the $U-B, B-V$ two-colour diagram occupied by the quasars.

The four comparison stars form the basis of a magnitude sequence that was used to calibrate a series of photographic observations made over the period 1972 August-December. IIaO plates were obtained on the $26-\mathrm{in}$. refractor at Herstmonceux, giving magnitudes close to the B system (see e.g. Penston \& Cannon

Fig. 2. Light curve of $4 C 31.63$ during 1972 August-December, taken from Table IV.
One photoelectric observation is plotted as a cross.
1970). The calibrated photographic results are shown in Table IV and Fig. 2. These indicate that the quasar is probably a variable without any signs of violent activity.

A spectrum was also obtained of Olsen's suggested identification of 4 C 24.6 . This proves to be a foreground star.

## ACKNOWLEDGMENTS

The authors are very grateful to Drs P. A. Strittmatter and R. J. Dickens for obtaining some of the spectroscopic material, and Drs R. G. Bingham and G. B.

Wellgate for help with the photoelectric measurements. The observers thank the relevant authorities for telescope time allocated.

Royal Greenwich Observatory, Herstmonceux Castle, Hailsham, Sussex
S. N. Henbest is now at Mullard Radio Astronomy Observatory, Cavendish Laboratory, Cambridge
